Revenue & Host Performance Analysis

A Power BI deep-dive into 100,200 bookings — where revenue concentrates, what drives it, and where the risk sits.

THE BRIEF

What This Analysis Set Out to Answer

Beyond visualizing KPIs, the goal was to answer three concrete business questions using a 100,200-row booking dataset across 80 properties, 50 hosts, and 20 NYC neighbourhoods.

01

Where is revenue actually concentrated?

Across hosts, neighbourhoods, and property types.

02

Is pricing power being left on the table?

Does charging more risk lower guest satisfaction?

03

Is recent growth holding up — or slowing down?

Tracking year-over-year trends across revenue and channels.

FINDING 01 • HOST CONCENTRATION

10 Hosts Drive Nearly Half of All Revenue

47.9%

of total revenue (\$84.3M of \$176.08M) comes from just 10 of 50 hosts on the platform.

50

total hosts

40

split remaining 52.1%

Recommendation: Build a dedicated retention program for top-tier hosts and diversify acquisition to reduce this dependency risk.

Price Has No Effect on Guest Satisfaction

Correlation between price and review score across all 100,200 bookings: -0.002 — effectively zero.

3.9

average review score — flat across every price tier tested

Guests aren't penalizing higher prices in their reviews — pricing and perceived quality are decoupled in this data.

Recommendation: A low-risk lever for revenue growth — underpriced hosts can raise rates without harming guest ratings.

FINDING 03 • INVENTORY MIX

Entire Home/Apt Is the Revenue Engine

Entire Home/Apt earns 3.2x more per booking than Private Rooms, while needing proportionally fewer bookings to do it.

Room Type	Revenue Share	Booking Share	Avg Revenue / Booking
Entire home/apt	77.7%	56.2%	\$2,430
Private room	13.5%	31.2%	\$758
Hotel room	7.2%	6.4%	\$1,968
Shared room	1.7%	6.2%	\$487

Revenue Share by Room Type

3.2x

more revenue per booking vs. Private Room — the clearest efficiency gap in the portfolio.

Recommendation: Prioritize host acquisition and marketing spend toward Entire Home/Apt inventory — the most revenue-efficient segment.

The Superhost Paradox

Superhosts win on volume — but Regular hosts earn more per booking, on average.

● Superhost

69.3%

of total revenue

71.1%

of bookings

\$1,713

avg revenue / booking

● Regular Host

30.7%

of total revenue

28.9%

of bookings

+9%

\$1,865

avg revenue / booking

Recommendation: Investigate whether Superhost listings are systematically underpriced relative to demand — a possible monetization gap.

Growth Isn't as Steady as the Headline Suggests

Revenue by Year

2025 broke the growth streak — first YoY decline (-2.2%) since tracking began.

Top Booking Channel by Room Type

No channel holds the #1 spot across every room type — or even across every year.

Recommendation: Investigate the 2025 dip before assuming growth continues, and match channel spend to the room type it performs best for.

PUTTING IT TOGETHER

Where to Focus Next

1

Protect against host concentration risk

Top 10 hosts hold 47.9% of revenue — build retention for them, diversify the rest.

2

Use pricing as a low-risk growth lever

Price has no measured effect on review scores — raise rates where demand allows.

3

Double down on Entire Home/Apt

3.2x revenue-per-booking vs. Private Room — the most efficient inventory segment.
